

Supplemental Figure 2

Supplemental Fig. 2. Binding of synthetic TAT and PPS peptides to HeLa cells. Biotinylated peptides were incubated with HeLa cells and bound peptide was detected by incubation with streptavidin-488 followed by fluorescence microscopy (top row of images). As a control, cells were treated with only streptavidin-488. White light images of cells in each treatment are shown in the bottom row. Scale bar = 200 μM.
